

Global E-Commerce Sales Analysis using SQL and Power BI

Objective: To analyze e-commerce sales performance, profit trends, shipping impact, and customer behaviour across regions, categories, and payment methods using SQL and Power BI.

Tools Used

- SQL (Data cleaning & analysis)
- Power BI (Dashboard creation & visualization)

Key KPIs

- Total Sales
- Total Profit
- Total Orders
- Average Order Value

Key Insights

- Regional sales vary significantly, with some regions performing better than others.
- Sales show seasonal fluctuations across quarters, with clear peaks in specific periods, indicating time-based demand patterns.
- Customer segments contribute differently to overall profit, showing variation in customer value contribution.
- Higher shipping costs in certain regions reduce profit margins indicating changes in logistics.
- Higher discounts are associated with lower profit in certain product categories.
- Payment methods show variation in average order value, reflecting different customer spending behaviour.
